

# Monkeypox (Mpox) An Emergence of African Origin

## Historical, Clinical, Epidemiological aspects, Reservoir and Current Situation

Antoine Gessain

Unité Épidémiologie et Physiopathologie des Virus Oncogènes

# Four main Chapters

1) History, Virus, Genetic variability, Reservoir

2) Clinical and epidemiological aspects of the african classical form

3) First emergence in 2022 and different aspects of the pandemic : *WHO Director-General declares mpox outbreak a public health emergency of international concern*

4) Second emergence in 2024 in DRC and East Africa  
*WHO Director-General declares mpox outbreak a public health emergency of international concern*

# Discovery and Isolation of Monkeypox Virus in 1958

FROM STATENS SERUMINSTITUT, DIRECTOR J. ØRSKOV, M.D.

## A POX-LIKE DISEASE IN CYNOMOLGUS MONKEYS

By

PREBEN VON MAGNUS, ELSE KRAG ANDERSEN,  
KNUD BIRKUM PETERSEN and AKSEL BIRCH-ANDERSEN

Received 27.ii.59

- In 1958 two outbreaks of a spontaneous non-fatal pox-like disease in cynomolgus monkeys have been observed in the colony of this Institute
  - Generalized maculopapular rash
  - General health quite unaffected with no fatal cases
  - Isolation of the virus from pustular lesions in eggs and in tissue culture
  - Serologically related to vaccinia virus
  - Typical brick-shape appearance of pox virus in EM
- It was called **monkeypox virus**

**Acute phase**  
with typical pustules

**Convalescent stage**  
lesions in healing and scars

Monkeypox virus on the chorio-allantoic membrane with typical discrete opaque foci

# First Recognized Human Monkeypox Case in Medical History

Between 1960 and 1968, several other MPX outbreaks were reported in captive monkey colonies in the USA and the Netherlands. No human cases were detected during these outbreaks, despite the death of many affected animals **suggesting that humans were not susceptible to monkeypox**

*Bull. Org. mond. Santé* } 1972, 46, 593-597  
*Bull. Wild Hlth Org.* }

A human infection caused by monkeypox virus in Basankusu Territory, Democratic Republic of the Congo \*

I. D. LADNYJ,<sup>1</sup> P. ZIEGLER,<sup>2</sup> & E. KIMA<sup>3</sup>

The first case of Monkey pox in human was reported in **1970** as part of the national smallpox surveillance and eradication program then underway in Africa.

This case occurred in a **nine-month-old-boy** who developed a fever, followed two days later by a **centrifugal skin rash**.

On Sept 1, 1970, he was admitted to Basankusu hospital, in the DRC with otitis, mastoiditis and **painfull cervical lymph nodes**. **MPXV was isolated from his skin lesions**.

He recovered from MPX but developed measles, leading to his death, before discharge.

# Human Monkeypox in West Africa 1970-1971

## 6 cases were reported mostly in children

*Bull. Org. mond. Santé* } 1972, 46, 569-576

 STANLEY O. FOSTER,<sup>4</sup> JAMES H. NAKANO,<sup>5</sup> & KENNETH L. HERRMANN<sup>6</sup>

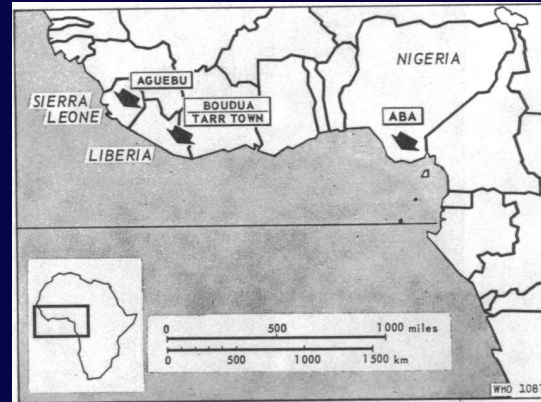

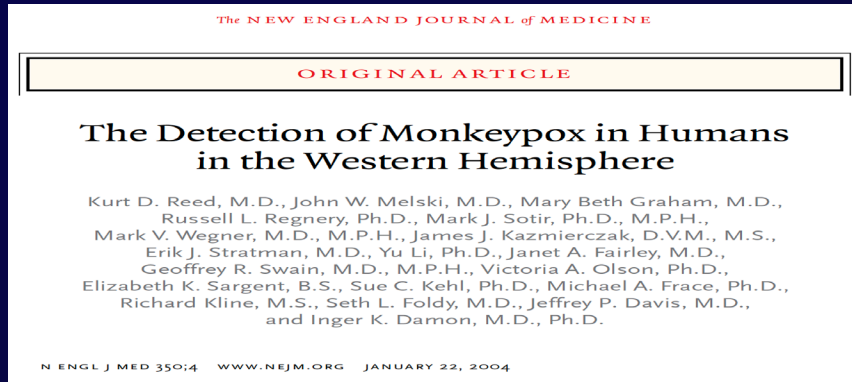

Fig. 2. Human monkeypox: eighth day of rash in 4-year-old female, Boudua, Liberia.

Monkeypox remained an **exclusively african disease** with sporadic cases in **forested areas of central and western Africa** and small **outbreaks** in the human population, mainly in **DRC**, until **2003** when the first cases out of Africa were reported.

# First Monkeypox in Humans out of Africa in 2003

-This event occurred in the **USA** and was linked to the importation of **Gambian pouched rats (*Crycetomys*)** from Ghana to Texas.

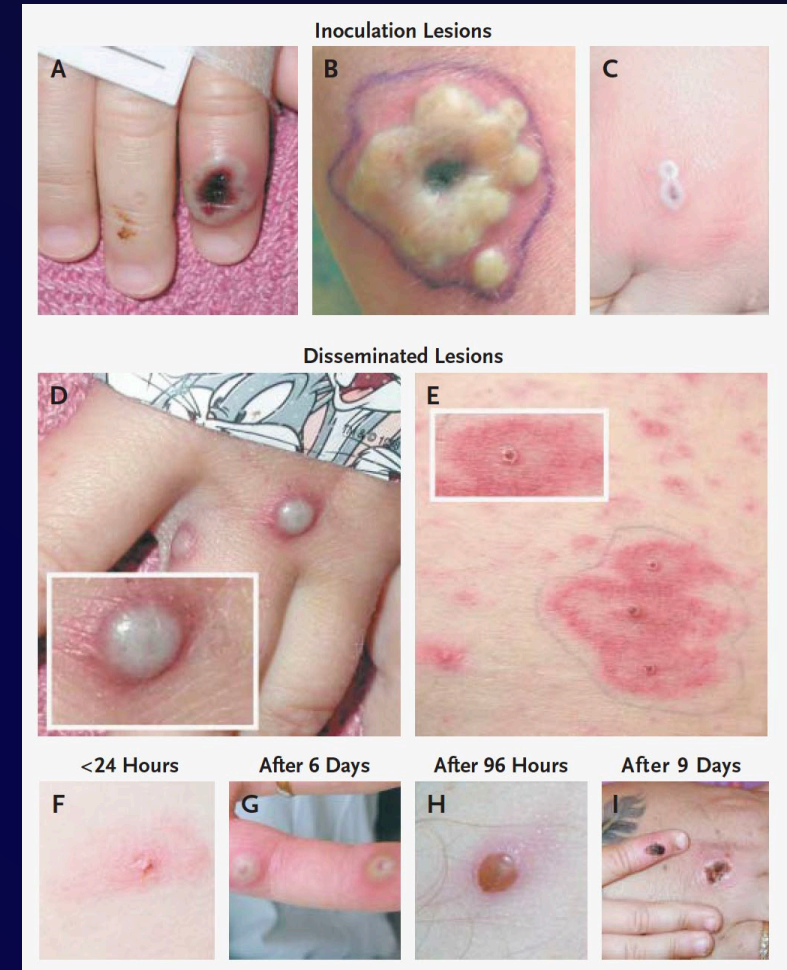

-These rodents transmitted the virus to **prairie dogs** housed at the same exotic animal facility, which then infected **humans mostly young adults and children** through bites or scratches.

-No deaths, few hospitalisations

- **MPXV** was isolated by cell culture from **7 patients** and **one prairie dog**.

Primary inoculation reactions (A, B, C)  
 Smallpox-like (D), umbilicated varicella-like (E)  
 Morphological appearance of lesions over time

### Reemergence of Human Monkeypox and Declining Population Immunity in the Context of Urbanization, Nigeria, 2017-2020

Phi-Yen Nguyen, Whenayon Simeon Ajişegiri, Valentina Costantino, Abrar A. Chughtai, C. Raina MacIntyre

# Monkeypox Virus

- *Poxviridae* family, *Chordopoxvirinae* subfamily
- **Orthopox genus** (*Variola virus*-smallpox, *vaccinia virus*-smallpox vaccine, cowpox, camelpox and recently isolated poxviruses-Alaskapox)
- MPXV is a large enveloped virus
- Each virion encapsulates a core containing a linear double-stranded DNA genome of 200 kilobase pairs encoding approximately 200 proteins

In EM, MPXV has the characteristics of a rectangular or ovoid brick

- Orthopoxviruses are very similar genetically and antigenically, which explains the cross-immunity, with some protection between them
- **Vaccination against smallpox generally protects against monkeypox (85% in a historical study in Zaire, central Africa)**
- This phenomena is one of the factors favoring the emergence of monkeypox

# Genetic Variability of Monkeypox

Historically, there are two genetic clades, genomes differ by around 5%, the first being endemic to **Central Africa**, the second to **West Africa**

With the emergence of MPXV outside of Africa, and need to destigmatize the disease and prevent discrimination, **definition of 2 clades** were done (Clade I and Clade II)

Co-existence of the two clades in **Cameroon**

## Reservoirs of Monkeypox

*Funisciurus anerythrus*

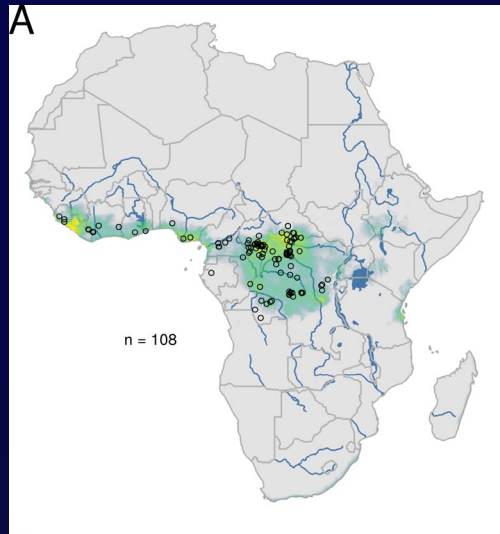

*Cricetomys*  
*giant pouched rats*

- Monkey pox is a sylvatic **zoonosis** but the **reservoir** of MPVX has **not yet been clearly identified**
- **Rodents**, including various species of **squirrel and rats** living in the **rain forests of Central and West Africa**, are among the best candidates
- African apes and monkeys are considered intermediate hosts
- Many animals, including rabbits, prairie dogs, other rodents and monkeys are susceptible to infection in captivity and in the laboratory

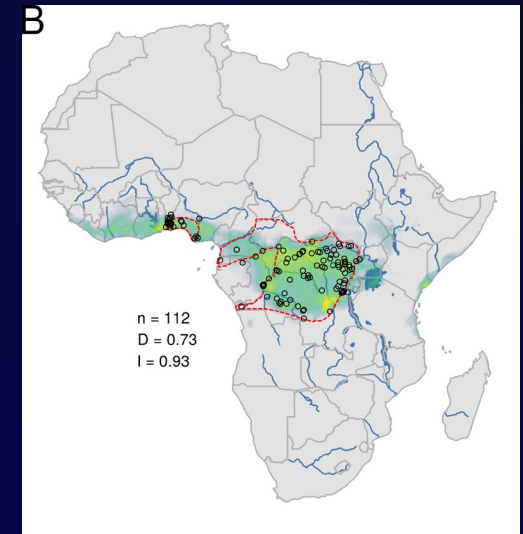

# What Are the Most Likely Animal Reservoir Hosts for MPXV?

## A Study Based on Ecological Niche Comparison

Ecological niche of MPXV

# Clinical Features in the African Setting

Based on case descriptions from the 1980 DRC, 2017 Nigeria, Rep. of Congo and CAR epidemics

MPX epidemics in **small remote villages in hard-to-reach rural forested areas.**

Often in the context of **armed conflicts or population movements**

Often associated with **poor medical infrastructure** and limited public health and health care staff resulting in **poor patient care and follow-up**

Clinical/epidemiological data obtained **retrospectively and often incomplete**

MPX affects both children and adults and generally has 3 phases :

**Incubation;** after primary infection, the average **13 days** (range 3-34 days)

**Prodrome;** one to four days **high fever, headaches, fatigue and often lymph-nodes (cervical and maxillary).** This distinguishes MPX from chickenpox (varicella)

# Eruptive Phase Monkeypox in the African Setting

Lasts 14-28 days

Centrifugal skin lesions appear and evolve through different stages; macules, papules, vesicles and finally pustules.

The lesions are firm, well-delimited and umbilicated, frequently on the palms and soles of the feet (different from chickenpox)

Each patient may have a few to several thousand lesions

Lesions are at the same stage of development

Severity of symptoms/disease are proportional to the density of skin lesions

Evolution into crusts that desquamate leaving areas of hypopigmentation followed by hyperpigmentation

Self-limiting course but clinical sequelae, facial scars are common

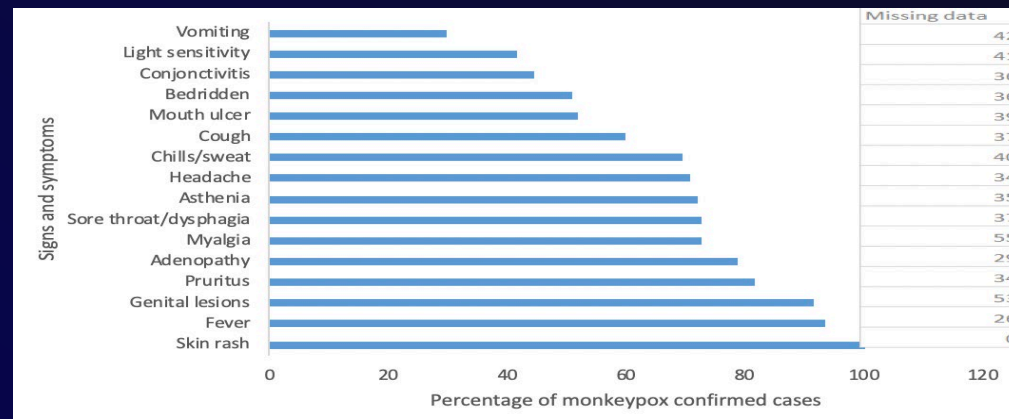

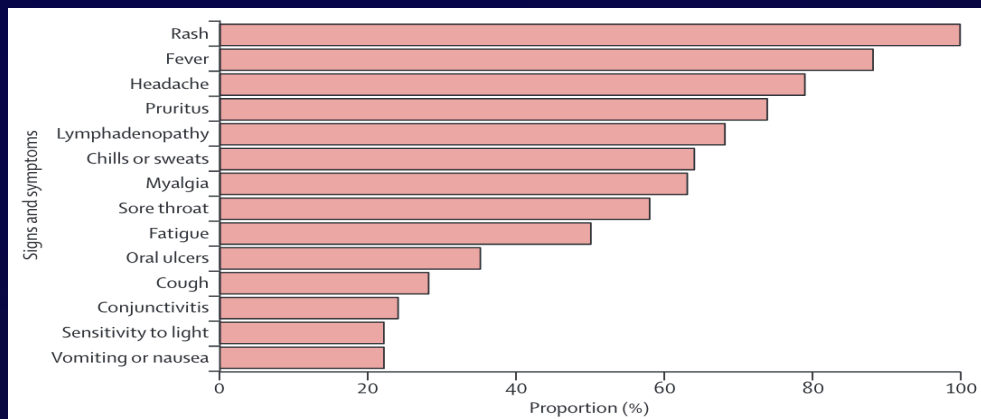

Most frequent complications are bacterial skin infections

Seems to be more severe in immunocompromized HIV-infected patients

# Most Frequent Clinical Signs of Monkeypox in the African Setting

Rash, Fever, Headaches, Pruritus, Lymphadenopathy,..

Frequency of signs and symptoms in people with confirmed monkeypox virus infection in Nigeria 2017-2018 (n=118) Ogunleye et al., Lancet Infectious Disease, 2019

Frequency of signs and symptoms in people with confirmed monkeypox virus infection in the CAR, 2001-2021 (n=99) Besombes et al., EID, 2022

## Case Fatality Fate of Monkeypox in an African classical Setting

The overall CFR appears to be lower in patients infected with West African strains (clade II) than in those infected with Central African strains (clade I)

The CFR was 6% in Nigeria but varied from 10-15% in DRC and CAR depending on the study

Death occur mostly in children and young adults with bacterial skin infections and sepsis and in

HIV-positive persons without antiretroviral therapy

# Epidemiological Aspects of Monkeypox in African Settings

Human monkeypox has been reported in ten African countries, with **a very large increase** in the number of case cases over the past three decades

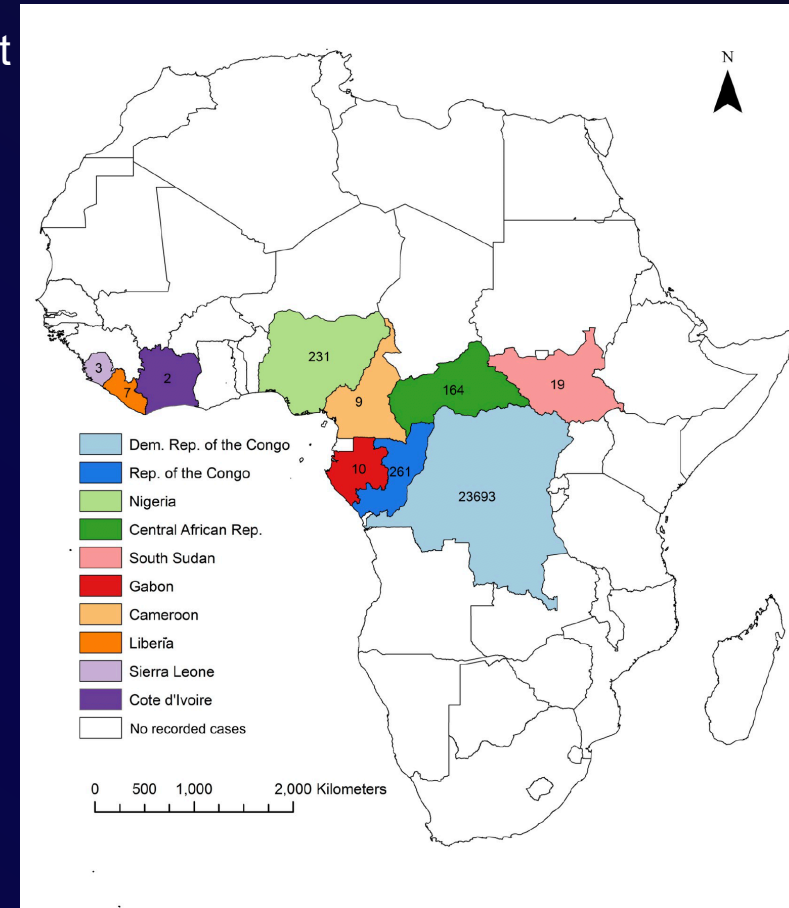

**The DRC** is, by far, the **most affected country** with a steady increase in suspected cases from less than 500 cases in 2011, more than 2,500 in 2018

Nigeria, Congo, CAR...

**Major increase in human monkeypox incidence 30 years after smallpox vaccination campaigns cease in the Democratic Republic of Congo**

PNAS | 16362-16267 | PNAS | September 14, 2010 | vol. 107 | no. 37 | www.pnas.org/cgi/doi/10.1073/pnas.1005769107

Map of Africa showing countries reporting human monkeypox cases (1971-2018)

**Increased ++ in median age at diagnosis over time**

- 1970/1980 most cases were in young children
- 2010-2019, median age was 21 years
- 2018/2018 Nigeria 29 years

**Large majority no vaccinated against smallpox**

**Either too young or born after vaccination was stopped**

# Transmission of Monkeypox in an African Settings

In Africa, both **animal-to-person** and **person-to-person** transmission has been documented

**Zoonotic transmission** via lesions/biological fluids from an infected animal (probably mainly rodents) when hunting, butchering or eating game

**No virological confirmation of interspecies transmission to date**

**Human-to-human transmission** occurs primarily through **contact with biological fluids and infected skin lesions of patients**

Contaminated materials such as bedding may also be infectious.

**The exact origin of transmission is often unknown**

# Transmission of Monkeypox in a classical African Settings

Nosocomial and Intrafamilial transmission have been reported

Sexual transmission poorly documented

Transmission chains are generally short (max 5-7 events)

Reproduction number  $R^0$  is estimated between 0.6-1 for Central African clade but lower for the West African viruses

Health authorities rapidly established that we were at the beginning of an outbreak of a new clinical and epidemiological form of monkeypox, different from that observed in Africa

# 2022 Outbreak of Monkeypox

The first case of Monkeypox in the outbreak was confirmed **in the UK on May 6 2022** in a man traveling from Nigeria

Unrelated cases with no documented history of travel to endemic countries were then reported in the UK and Portugal, suggesting undetected local transmission **with earlier onset dates of symptoms in late April 2022**

WHO declared global health emergency on July 22

By septembre 10, **around 80 000** cases of MPX infection have been reported in >100 locations worldwide with >95% in countries not historically endemic (**USA, Spain, Brazil** and France)  
>97% in men who identify as **MSM**

MPXV has been transmitted primarily in **interconnected sexual networks that sustain STIs.**

**Transmission through Sexual Contacts**

# Clinical Aspects of the Monkeypox Outbreak

The clinical aspects seem to correspond to the classical presentation (incubation, prodromal and eruptive phase) but with some differences that give rise to **a new pattern**

Incubation 9.2 days

Lesions are also frequently observed without prodromal phase

The pattern of skin lesions is often unusual sometimes with only a few painless lesions, but also often in **genital, anal and perianal areas** (rectitits) and oral lesions (pharyngitis)

# Comparison of the Classical African and the New Clinico-Epidemiological Form of Monkeypox

**Table 1.** Features of the Classic Form of Monkeypox and the New Clinical–Epidemiologic Form.

Variable	Classic Form, 1970s to the Present	New Clinical–Epidemiologic Form, 2022
Location	Central and West Africa	Countries where monkeypox is not endemic (Europe, North and South America, Middle East, Australia)
Affected population	Children and young adults (age at diagnosis increasing since 1980)	Young men who have sex with men (age, 31–40 yr)
Epidemiologic features	Sporadic cases and epidemics	Pandemic under way since May 2022
Transmission	Contact with infected animal reservoir (probably rodents), followed by human-to-human transmission	Exclusively human-to-human transmission
Dissemination	Mostly intrafamilial and limited nosocomial dissemination	Mostly sexual networking, condomless sex with multiple male partners
Clinical phase	Incubation, prodromal stage, eruption phase with skin lesions	Incubation, prodromal stage (not always present), eruption phase with lesions in an unusual distribution, especially on the genitals
Symptoms	Lesions on the face and extremities, with centrifugal distribution, often associated with cervical or axillary lymphadenopathy	Penile rash, perianal lesions, ulcerative lesions and vesicular rash, painful inguinal lymphadenopathy, pharyngitis, proctitis
Viruses	Central African and West African clades (clades 1 and 2, respectively)	West African variant (clade 3)
Case fatality rate (%)	1–15	0.025

From Gessain et al., *New England Journal of Medicine*, 2022

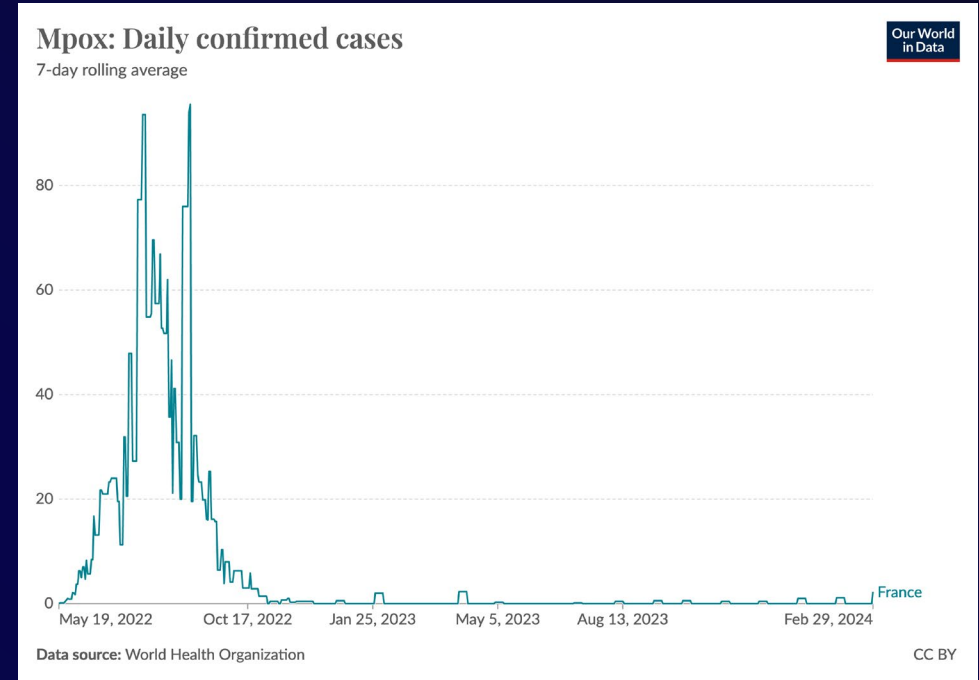

# Natural History of Monkeypox

# Current situation 2024 :

The epidemic is almost over in countries with a high socio-economic level

This is due to **information** and **prevention efforts** and the use of **therapeutics** and **vaccination** in the **population at risk**  
(mainly Gay, Bisexual, MSM with multiple partners)

The epidemic was remarkably controlled by the mobilization of targeted high risk populations with **behavioral modifications to avoid Mpxv** and the **high uptake and effectiveness of anti-smallpox vaccination**

MVA–BN is a third generation live attenuated non-replicating **modified Vaccinia Ankara vaccine** developed by **Bavarian Nordic**

Use of treatment : **Tecovirimat** (inhibitor of orthopoxvirus protein P37) and Brincidofovir (inhibitor of viral DNA polymerase led possibly to decrease the duration of viral shedding and illness (not demonstrated).

## Mpox (monkeypox) risk and mortality associated with HIV infection: a national case-control study in Nigeria

Adesola Yinka-Ogunleye,<sup>1,2</sup> Mahmood Dalhat,<sup>3,4</sup> Afolabi Akinpelu,<sup>5</sup> Olusola Aruna,<sup>6</sup> Fatima Garba,<sup>7</sup> Adama Ahmad,<sup>5</sup> Adesola Adeleye,<sup>5</sup> Iliya Botson,<sup>5</sup> Bamidele Oluwafemi,<sup>5</sup> Oladipo Ogunbode,<sup>8</sup> Lateefat Amao,<sup>8</sup> Udem Ekpipo,<sup>9</sup> Gambo Gumel Aliyu,<sup>10</sup> Ifedayo Adetifa,<sup>11,12</sup> Chikwe Ihekweazu,<sup>11</sup> Ibrahim Abubakar<sup>2</sup>

Yinka-Ogunleye A, et al. *BMJ Glob Health* 2023;8:e013126. doi:10.1136/bmjgh-2023-013126 1

Higher mortality in people with more advanced HIV

Among 382 persons with 107 hospitalized, 27 died.

All death occurred in people with CD4 counts of less than 200 cells/mm<sup>3</sup>

Case fatality rate was 9.4% (8/86) and 20.8% (5/24) overall and in HIV positive cases respectively

High risk in children dying from Mpox infection irrespective of HIV status

# Phylogeny of the Monkeypox Virus Strains of the Outbreak

These MPXV belong to **clade 2b**, within the formerly West African clade 2

Divergent branch lineage B1 descendant from a branch with viruses (A1) associated with exportation of MPXV in 2018/2019 from Nigeria to UK, Israel, Singapore.

The outbreak most likely has a single origin

## Sustained human outbreak of a new MPXV clade I lineage in eastern Democratic Republic of the Congo

Vakaniaki, E.H., Kacita, C., Kinganda-Lusamaki, E. et al.

Nat Med 30, 2791–2795 (2024). <https://doi.org/10.1038/s41591-024-03130-3>

Kamituga  
nearby Bukavu city  
and east african  
countries  
(Burundi, Rwanda,..)

241 suspected cases  
90% of 119 tested cases MPXV +

Majority are  
women

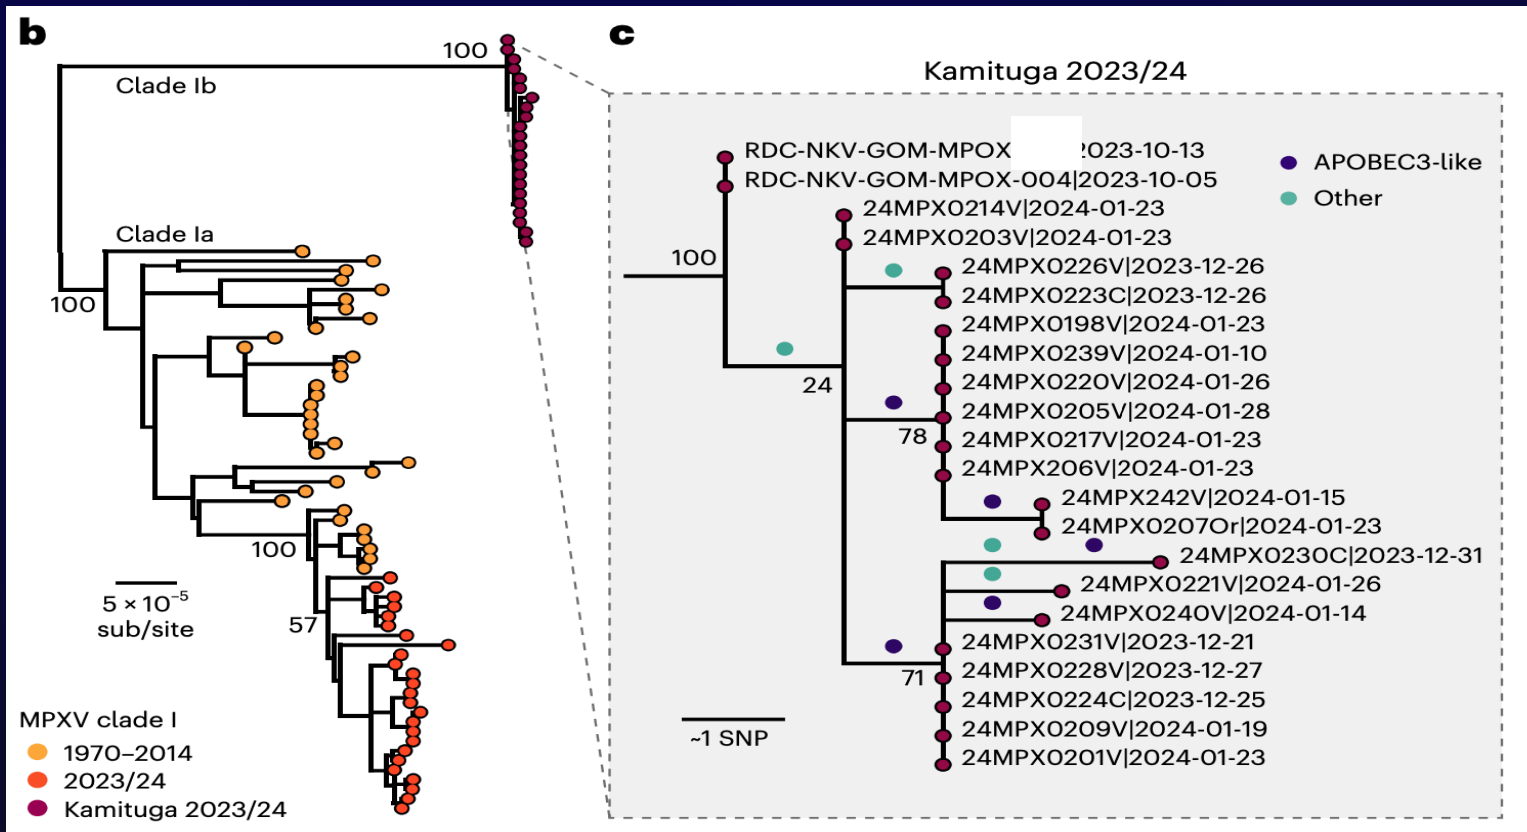

Median age 22  
years

Frequent  
sex workers

# Phylogenetic studies demonstrated the **existence of a new lineage in the clade 1**

The predominance of APOBEC3 mutations support that the entire cluster resulted from **human to human transmission** and the low genetic diversity indicate **a recent outbreak**

This new lineage was named **clade 1b**

The situation in Kamituga mirrors the 2017/2018 outbreak of **clade 2b in Nigeria**

# WHO declared global health emergency on August 24

"The emergence of a new clade of mpox, its rapid spread in eastern DRC, and the reporting of cases in several neighbouring countries are very worrying. On top of outbreaks of other mpox clades in DRC and other countries in Africa, it's clear that a coordinated international response is needed to stop these outbreaks and save lives."

## Mpox: Cumulative confirmed and suspected cases

Our World in Data

Confirmed cases are those that have been verified through laboratory testing. Suspected cases are those where mpox is likely based on an individual's initial clinical signs and symptoms, but the diagnosis has not yet been confirmed through laboratory testing.

**Fatal Alaskapox Infection in a Southcentral Alaska Resident**

(Contributed by: Julia H. Rogers PhD, MPH and Katherine Newell, DPhil, MPH, Alaska Section of Epidemiology; Benjamin Westley, MD, Infectious Disease, Anchorage, AK; John Laurance, Alaska State Public Health Laboratory.)

In 2024, **first report severe case** of Alaska pox infection resulting in hospitalization and **death**.

Patient with history of drug-immunosuppression secondary to cancer treatment.

Contact with a **stray cat** that regularly hunted small mammals and frequently scratched the patient.

*Viruses* 2019, 11, 708; doi:10.3390/v11080708 [www.mdpi.com/journal/viruses](http://www.mdpi.com/journal/viruses)

Seven Alaska pox cases have been reported in Residents of the Fairbanks area.

**Self-limiting illness consisting of a localized rash and lymphadenopathy.**

Small mammals tested : four different species mainly « red back voles » -campagnoles à dos rouge

# Conclusion

The 2022 and 2024 Mpox outbreaks reminds us that **viral emergence is a permanent phenomenon without boundaries and often unpredictable in its nature, its target and magnitude : a never-ending story?**
